

FitBuddy – AI Fitness Plan Generator

6. Project Testing Phase

Testing Objective

Testing verifies that user input, AI generation, feedback updates, database storage, routes, templates, and local deployment work as intended.

Input Testing

Check that required user information such as username, user ID, age, weight, goal, and intensity is accepted correctly.

Workout Generation Testing

Submit different goals and intensity values and verify that a structured 7-day plan is returned.

Nutrition Tip Testing

Verify that the nutrition/recovery tip is generated and displayed for the selected fitness goal.

Feedback Testing

Submit feedback such as adding cardio or rest days and verify that the plan is revised and stored.

Database Testing

Verify that user information, original plans, and updated plans are saved and retrieved correctly.

Route Testing

Test the home, workout-generation, feedback, and administrator routes.

Deployment Testing

Run the application locally with Uvicorn and verify access through the local application URL and FastAPI /docs interface.

Project: FitBuddy – AI Fitness Plan Generator using Gemini Models.
